Abstract

Table 1

The anxiety treatment significantly increased skin conductance reactivity

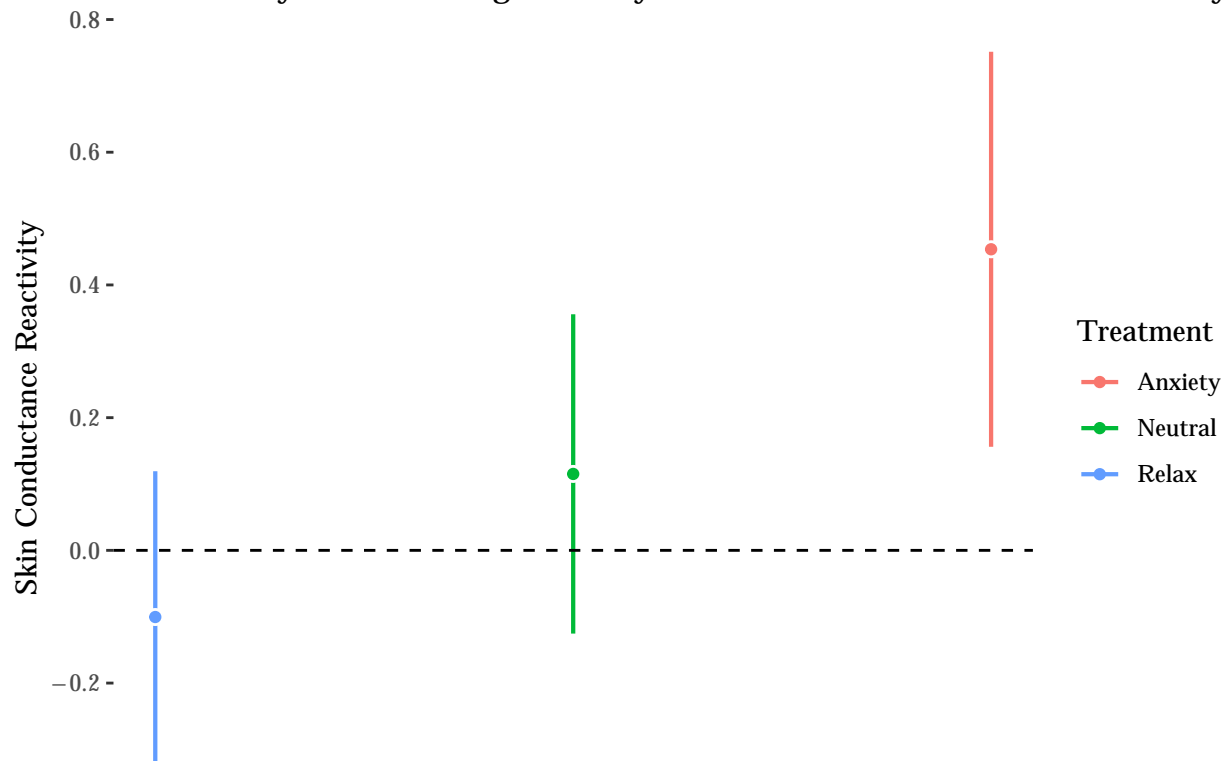

Figure 2. Means of skin-conductance reactivity by video condition. 95% confidence intervals shown.

The indirect effect of physiological reactivity (ACME) is positive and significant

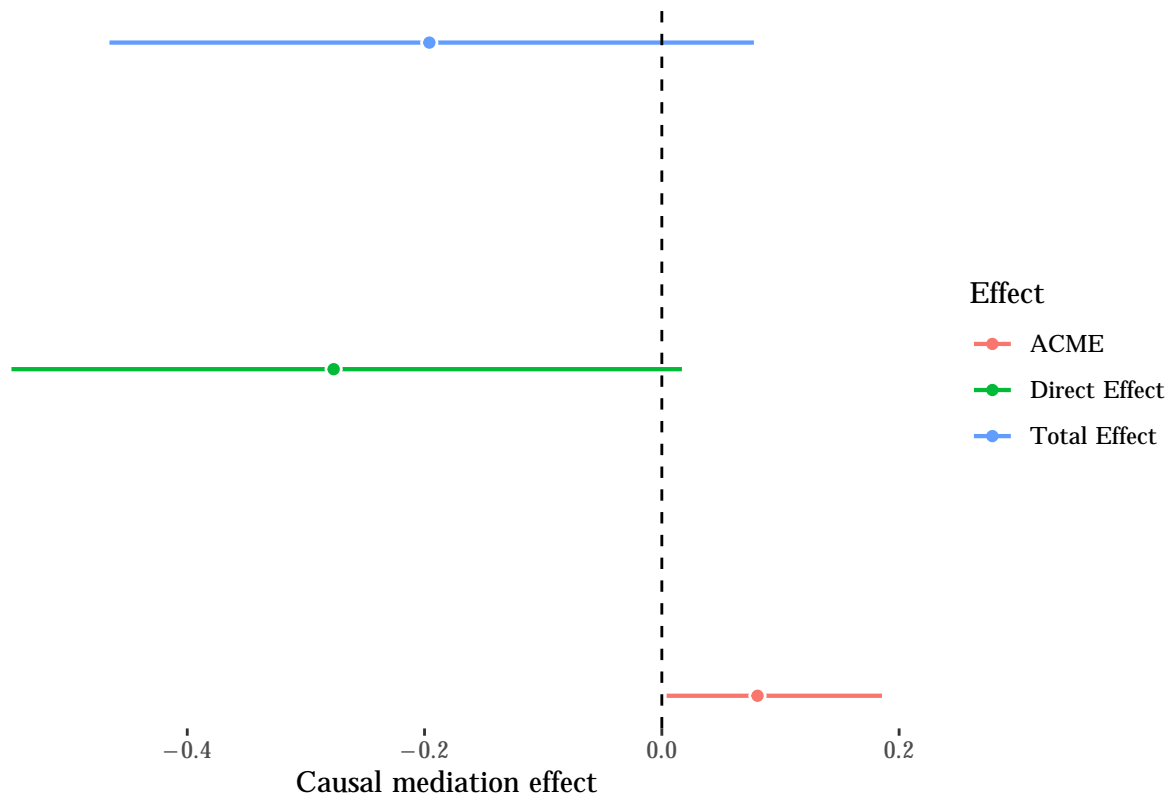

Figure 3. “*Treatment* is anxiety video manipulation (compared to neutral condition), *Mediator* is skin conductance reactivity when answering immigration questions, *Outcome* is composite variable of immigration preferences. Horizontal lines represent 90% confidence intervals for estimates.” (p. 11)
